Heating Panels for Wall & Ceiling

Facade Coatings

## Facade Coatings :: Product Information

**Metal facades that look like stone or mortar!**

### Surface Material:

The surface is a fine, grainy sand structure with one or more colours and with arbitrary structures. The surface is durable and the colours are stable over time.

### Core Material:

The surface is coated onto conventional facade material: aluminium, zinc, steel, but also plastic, composites and ceramic / concrete are possible.

### Formats:

The finished sidings or sheets are coated, the size depends on the carrier core. The coated sidings or sheets can be cut to length at the construction site, only edging/bending is not possible after coating to avoid reduction in quality.

### Colours and Design:

All colours and designs in our current colour chart.

### Use:

Use a metal facade that is extremely durable. With our coating you can have the look and feel of plastering and conventional stucco.

### Mounting:

The mounting depends on the structure and thickness of the carrier core that is used. It ranges from adhesive bonding to mechanical fixture (screws, nails or rivets).

### Subconstruction:

Depeding on the carrier core and the wall the panels can be installed with the conventional subconstruction. Metal systems or wood slats are used in most cases.
